Designing sine-wave oscillators. Figure 1 shows the canonical form of a feedback system, and the following equation describes the performance of any negative feedback system. Oscillation results from an unstable state because you cannot satisfy the feedback-system transfer function. The equation becomes unstable when $(1+A) = 0$ because $A/0$ is an

undefined state, so the key to designing an oscillator is to insure that $A = -1 = 180^\circ$.
