By understanding the fundamental principles and conducting proper flow properties tests, a chemical engineer can design reliable systems for storing and handling bulk solids. Knowing the relationship between a material's cohesive strength and consolidation stress allows the engineer to calculate hopper-outlet dimensions that will prevent flow obstructions from developing.

This chapter discusses the solid handling unit operation blocks, such as Dryer, Crystallizer, Filter, and Cyclone, in Aspen Plus. The dryer models the

removal of water or other liquid from the solid material by evaporation of this liquid to an air stream to reduce the content of moisture to an acceptable level.

Solid Handling - Chemical Process Design and Simulation ...

There are many pieces of process equipment aimed at handling solids. A bin is a vertical vessel used for storing solids. Large bins with with roughly a height to diameter ratio of 1.5 are called silos. Bins with height to diameter ratio less than this are called bunkers. From a silo or bunker solids will move out of an orifice, or hopper, to a feeder.

Solids-involved equipment - processdesign

Bulk solids handling often creates critical bottlenecks that can limit production quantity and quality due to flow problems. These commonly occur as a result of improper equipment design. Fortunately, flow issues can be predicted and prevented by performing flow properties testing on your material. By using data and the proven scientific design approach, you can reliably and effectively ensure your bulk solids handling operations deliver the desired performance.
