In statistics, a fixed effects model is a statistical model in which the model parameters are fixed or non-random quantities. This is in contrast to random effects models and mixed models in which all or some of the model parameters are random variables. In many applications including econometrics and biostatistics a fixed effects model refers to a regression model in which the group means are fixed as opposed to a random effects model in

The Fixed Effects Regression Model. The fixed effects regression model is.
$$Y_{it} = \beta_1 X_{1,it} + \dots + \beta_k X_{k,it} + \alpha_i + u_{it} \quad (10.3)$$

$$Y_{it} = \beta_1 X_{1,it} + \dots + \beta_k X_{k,it} + \alpha_i + u_{it}$$
 with $i = 1, \dots, n$ and $t = 1, \dots, T$. The α_i are entity-specific intercepts that capture heterogeneities across entities.

A fixed effects regression consists in subtracting the time mean from each variable in the model and then estimating the resulting transformed model by Ordinary Least Squares. This procedure, known as “within” transformation, allows one to drop the unobserved component and consistently estimate β . Analytically, the above model becomes

For repeated events, fixed-effects regression methods—which control for all stable covariates—can be implemented by doing Cox regression with stratification on individuals. For nonrepeated events, we consider the use of conditional logistic regression to estimate fixed-effects models with discrete-time data.

FIXED-EFFECTS METHODS FOR THE ANALYSIS OF NONREPEATED EVENTS

8.1 Preliminaries. Mixed-effects logistic regression (MELR) is to logistic regression as linear mixed-effects models are to linear regression. MELRs combine pieces we have seen previously in chapters on logistic regression and linear mixed-effects models: Logistic regression. Binary response Y . Ex: tapped = 1 or 0, in the tapping dataset. Model log-odds that Y happens.

Quantitative Methods for Linguistic Data

A regression model that contains a mixture of both quantitative and qualitative variables is called an Analysis of Covariance (ANCOVA) model. ANCOVA models are extensions of ANOVA models. They statistically control for the effects of quantitative explanatory variables (also called covariates or control variables).

Essentially add industry specific constant terms (/dummies) to a regression model. In the context of a cross-sectional asset pricing regression this intuitively captures the mean return of all stocks in the same industry.

Fixed-effects models are a class of statistical models in which the levels (i.e., values) of independent variables are assumed to be fixed (i.e., constant), and only the dependent variable changes in response to the levels of independent variables.

Fixed-Effects Models - SAGE Research Methods

Fixed effects models Allison says “In a fixed effects model, the unobserved variables are allowed to have any associations whatsoever with the observed variables.” Fixed effects models control for, or partial out, the effects of time-invariant variables with time-invariant effects.
