This is a vector space; some examples of vectors in it are $4\mathbf{e}_x - 31\mathbf{e}_{2x}$, $\pi\mathbf{e}_{2x} - 4\mathbf{e}_x$ and $1\mathbf{e}_{2x}$. A hyperplane which does not contain the origin cannot be a vector space because it fails condition (+iv). It is also possible to build new vector spaces from old ones using the product of sets. Trivial or zero vector space. The simplest example of a vector space is the trivial one: $\{0\}$, which contains only the zero vector (see the third axiom in the Vector space article). Both vector addition and scalar multiplication are trivial. A basis for this vector space is the empty set, so that $\{0\}$ is the 0-dimensional vector space over F.

Let F be a field and n a natural number. Then $\mathbb{F}^n$ forms a vector space under tuple addition and scalar multiplication where scalars are elements of F. $\mathbb{F}^n$ is probably the most common vector space studied, especially when $F = \mathbb{R}$ and $n \leq 3$. For example, $\mathbb{R}^2$ is often depicted by a 2-dimensional plane and $\mathbb{R}^3$ by a 3-dimensional space.

Vector space: informal description Vector space = linear space = a set V of objects (called vectors) that can be added and scaled. Vector space - Wikipedia

A vector space or a linear space is a group of objects called vectors, added collectively and multiplied (“scaled”) by numbers, called scalars. Scalars

are usually considered to be real numbers. But there are few cases of scalar multiplication by rational numbers, complex numbers, etc. with vector spaces.

Vector Space- Definition, Axioms, Properties and Examples
A vector space may be loosely defined as a set of lists of values that can be added and subtracted with one another, and which can be scaled by another set of values. The most familiar examples vector spaces are those representing two or three dimensional space, such as R2 or R3, in which the vectors are things like (x,y) and (x,y,z).
