A tidal disruption event (also known as a tidal disruption flare) is an astronomical phenomenon that occurs when a star approaches sufficiently close to a supermassive black hole and is pulled apart by the black hole's tidal force, experiencing spaghettification. A portion of the star's mass can be captured into an accretion disk around the black hole, resulting in a temporary flare of electromagnetic radiation as matter in the disk is consumed by the black hole.

The black hole's "size" is defined as the Schwarzschild radius or the radius at which nothing can escape the black hole. The mass of a black hole also determines its "tidal disruption radius", or the radius at which the black hole is likely to disrupt a star. The tidal disruption radius scales to the 1/3

power with the mass of the black hole, meaning that a black hole that is 8 times more massive will have a tidal disruption radius that's only 2 times more massive.
