**Atomic Spectra Lab  
Answer Key**

The electromagnetic spectrum is shown at the beginning of this document. Recall that energy is proportional to frequency, while frequency is inversely proportional to wavelength. Use this information to answer questions 1-4 below. List the colors observed in this lab from the highest energy to the lowest energy.

Since each atom has many excited states (high energy levels) available to it, several colors of light can be emitted by each element. The set of individual colors emitted by an element is called its spectrum. Since the spectrum of each element is unique, spectra can be used like fingerprints to identify unknown elements. Wavelengths of Light

When a pure atomic gas such as hydrogen or helium is subjected to a high-voltage electrical discharge, light is produced and the gas glows. When this light is observed through a diffraction grating, a series of bright colored lines is

observed. The series of bright lines is called an atomic emission spectrum and is unique to each element.

PHY 124 - Atomic Spectra. The purpose of this laboratory is to study transitions between energy levels of the hydrogen atom by observing the spectrum of light emitted when the atoms make transitions from higher- to lower-lying quantized energy levels. To measure the wavelengths of the emitted light, you will use a transmission diffraction grating in a simple apparatus.

Atomic Emission Spectra Prepared by Zach Gray and Edward L. Brown, Lee University Students will observe the emission spectra of various atoms both visually and with a direct reading spectroscope. The wavelengths obtained from the spectroscope will be used to calculate the energies of Hydrogen's electronic transitions.
