The resonance frequency is defined as the frequency at which the impedance of the circuit is purely real, that is, with zero reactance. For the reactance to be zero, impedance of the inductor must equal that of the capacitor. At resonance, the impedance of a branch with LC in series is equal to zero, which is equivalent to a short, and the admittance of a branch with LC in parallel is equal to zero, which is equivalent to an open.

Ideally, a series LC circuit would have zero impedance at the resonant frequency, while a parallel LC circuit would have an infinite impedance at the resonant frequency. In the real world, of course, resonant circuits don't act this way. Both inductors and capacitors have a series resistance that needs to be taken into
