Organic Luminescent Materials

Dear Colleagues, Luminescent materials
are increasingly attractive,
fundamentally for their beauty and
intriguing features and practically for

their potential applications in devices and probes. Organic luminescent materials have become valuable alternatives to inorganic luminophores but are still rare, because most organic chromophores suffer a dramatic quenching of their emission when they pass from dilute solutions to concentrated solutions or to solid states.

Later, other materials, such as certain metal oxides, silicates, and phosphates, were found to luminesce if they were prepared by special procedures. Sulfide-type phosphors, activators, fluxes. The sulfides of zinc and of cadmium are the most important basic materials of sulfide-type phosphors. An important

condition of getting highly efficient phosphors is that these sulfides must first be prepared to the highest possible chemical purity before the necessary amount of activator can be added ...

Luminescence, emission of light by certain materials when they are relatively cool. It is in contrast to light emitted from incandescent bodies, such as burning wood or coal, molten iron, and wire heated by an electric current. Luminescence may be seen in neon and fluorescent lamps; television, radar, and X-ray fluoroscope screens; organic substances such as luminol or the luciferins in fireflies and glowworms; certain pigments used in outdoor

advertising; and also natural electrical ...

An organic light-emitting diode (OLED or organic LED), also known as organic electroluminescent (organic EL) diode, is a light-emitting diode (LED) in which the emissive electroluminescent layer is a film of organic compound that emits light in response to an electric current. This organic layer is situated between

two electrodes; typically, at least one of these electrodes is transparent.

The preparation of a blue-luminescent and photostable organic-inorganic hybrid perovskite with an X-ray powder diffraction spectrum consistent with a two-dimensional inorganic framework is reported. This perovskite can be produced with a high reaction yield and valuable optical properties, such as

luminescence quantum yield over 20%, radiative rate constant of up to $80 \times 10^6 \text{ s}^{-1}$, and high photostability under UV light.
